

install vs. delete readback, before and after the W1 fix

BEFORE — kernel cca5e3e4, 2026-09-04

group_id	install_group_entry	groupdesc (switch truth)	delete_group_entry (same id)
4294967295 (OFPG_ALL, reserved)	200 {"outcome": "installed"}	absent	404 {"outcome": "no_such_group"}
4294967293 (reserved)	200 {"outcome": "installed"}	absent	404 {"outcome": "no_such_group"}

AFTER — kernel 4c9e0be1, 2026-09-05

group_id	install_group_entry	groupdesc (switch truth)	delete_group_entry (same id)
4294967295 (OFPG_ALL, reserved)	502 {"outcome": "absent"} “the switch did NOT take it”	absent	404 {"outcome": "no_such_group"}
4294967293 (reserved)	502 {"outcome": "absent"} “the switch did NOT take it”	absent	404 {"outcome": "no_such_group"}
813 (control, OVS accepts)	200 {"outcome": "installed"}	present (type SELECT)	200 {"outcome": "deleted"}
899 (control, never installed)	— not attempted (modify: 404 no_such_group)	absent	— not attempted

install now says “installed” only once the switch has taken it
